

=====

PART 1: How Text & Hidden Strings are Extracted

=====

Q: Does Aegis scrape the DOM of the website to find hidden text?

A: No! Aegis is a system-level clipboard guardian, not a browser extension. When a user highlights text on a webpage and presses

Aegis simply monitors the OS clipboard using the 'pyperclip' library. It intercepts the payload AFTER the browser has copied it, b

Q: How does Aegis handle JavaScript clipboard hijacking?

A: Websites can use 'event.clipboardData.setData()' in Javascript to intercept a Ctrl+C action and replace the highlighted text with

=====

PART 2: Hackathon Judge Q&A

=====

Q1: Why did you build this as a system tray application instead of a browser extension?

A: A browser extension only protects the user while they are in that specific browser. By building Aegis as a system-level backgrou

Q2: How do you prevent infinite loops if the user copies the same text twice, or when Aegis sanitizes and overwrites the clipboard?

A: Aegis creates a cryptographic SHA-256 hash of the clipboard contents. It stores the hash of the last inspected payload. If the cli

Q3: Isn't sending clipboard data to an AI model for analysis a massive privacy risk?

A: Yes, which is why we built the "Privacy Guard". Aegis never sends data to the cloud AI without explicit consent. Furthermore, i

Q4: What happens if the AI API is down or the user has no internet connection?

A: Aegis uses a Dual-Tier architecture. Tier 1 is a hardcoded, instantaneous regex engine that runs locally and catches the most dan

Q5: Why did you use 'subprocess' to render the Tkinter GUI prompt?

A: The clipboard monitor runs in a background thread to prevent locking up the system tray icon loop. However, on Linux/X11 and

Q6: What is the performance impact of polling the clipboard?

A: Minimal. The daemon uses asyncio to poll every 0.5 seconds, and the first step is a lightweight SHA-256 hash comparison. If th
